External cooling of the rotor blades of turbines with
 an air-water mixture makes it possible, in principle,
 to ensure normal operating conditions at any temperature.
 The thermal stresses in the disc of the turbine
 rotor wheel may also be reduced. Operating experience
 of steam turbines shows that substantial destruction
 of the inlet edges of blades, made from
 readily available materials, is observed at a high degree
 of steam wetness (more than 10 - 12%) during the
 course of many thousands of hours of operation. With
 a relative water consumption of 0.2 - 1% of the gas
